

# Inclusive Disaster Resilience Index

## The project Inclusive Disaster Resilience Index (*INDRIX*)

Demographic and social change as well as an increase in natural disasters due to climate change are making the matter of community resilience ever more pressing. Emergency planning and resilience-increasing efforts in Europe vary by region and focuses, making it challenging to assess gaps and opportunities for improvement.

The project INDRIX is developing a social resilience index with a particular focus on inclusion of vulnerable groups of people. To achieve this, the project brings together stakeholders from social services, civil protection, and representatives of the target groups.

## Self-assessment of communities, individuals, and civil protection projects

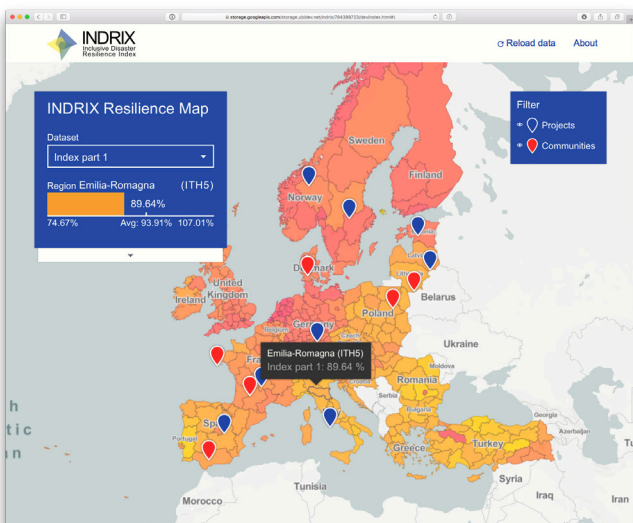

The INDRIX social resilience index is suitable for assessment of community resilience, based on statistical data as well as data entered for just this purpose. Individuals can also use a questionnaire to clarify their resilience situation.

Project coordinators working in the area of civil protection can use INDRIX to assess the resilience focus of their projects or project proposals. Decision-makers in civil protection policy can evaluate proposed new initiatives by their consideration of major resilience factors.

INDRIX is also useful for research in areas concerning resilience and civil protection.

## Easy to use data tool

As part of INDRIX, a visualisation software was developed that enabled easy access to the information thus far evaluated with the help of the index. Regional resilience factors are shown on an intuitive map, project or initiative assessments are visualised equally simple. This facilitates usage of the information by stakeholders envisioned by the project and beyond.
